

Compass Enterprise v4.2.0

This release of the Compass Enterprise suite incorporates new features that have been developed as a direct result of user feedback. Additionally, user experience and performance improvements have been addressed as well as the resolution of some product defects.

Metadata Entry

- Metadata records can now be saved without the requirement to complete all mandatory fields. This aids in rapid metadata creation and ensures quality of metadata is allowed.
- Metadata group is now automatically assigned when creating new entries.
- Thumbnails are now regenerated when editing existing metadata entries.
- Date fields that were attributed to default to the Modified Date of the file system will have their value updated accordingly when editing existing metadata entries.

Lookup Maintenance

- Value lists can now be imported into Lookups from CSV source files.
- Lookup values can now optionally be marked as invisible for metadata selection.

General Maintenance

- Document thumbnails can now be updated in a single process for all valid file entries. This process regenerates an image from the source file for all files that have been modified since being catalogued.
- Date fields attributed to file system Modified Date values can now have this value updated in parallel with the thumbnail process thus keeping metadata current.

General Improvements and Fixes

- Compass now targets the .NET 4.0 Framework.
- Thumbnails can now be generated for 3D file data sources.
- Catalogue / Database updates will now be run from a new toolbar in Compass Master. This will execute scripts to make changes to catalogue schema.
